We normally think of the frequency of oscillatory motion as the number of cycles completed per second. This is called the rotational frequency, and is given by $f = 1/T$. It is related to the angular frequency by $\omega = 2\pi f$. The rotational frequency is usually easier to measure than the angular frequency, but the angular frequency tends to be used more often in theoretical discussions.

We review recent work on Raman spectroscopy of graphite and graphene. We focus on the origin of the D and G peaks and the second order of the D peak. The G and 2 D Raman peaks change in shape, position and relative intensity with number of graphene layers. This reflects the evolution of the electronic structure and electron-phonon interactions.
